soyMAIL Overview

soyMAIL provides authenticated Web access to an account's VMS Mail. All that is required at the client end is a (relatively) modern browser that supports CSS. JavaScript enhances the functionality of soyMAIL but is not essential to it's use.

soyMAIL has been developed and tested against these browsers

> Firefox 1.5 (Win32)
> Mozilla 1.7 (Win32 and VMS)
> Opera 9.0 (Win32)
> MSIE 6.0 and 7.0 (Win32)

these VMS Web server environments

> Apache (SWS) 2.1 and 1.3
> OSU 3.10
> Purveyor 1.2
> WASD 9.1

and is suitable for all VMS platforms and versions from V6.0 onwards.

soyMAIL supports

> receiving and sending:
>
>> native VMS Mail messages
>> Internet (SMTP) mail messages
>> MIME messaging and attachments
>> HTML format message text
>
> message content search
> contact (address) maintenance
> context-sensitive help
> user options (including theme and language)

soyMAIL has been carefully and extensively optimized to perform well within the general VMS environment and across both intranets and the Internet.
